Ideation phase

Define the problem statement

Date	**29/9/2026**
Team ID	**SWTID-2026-5649**
Project Title	**Implement Client Script & UI Policy (Incident)**

Problem Statement:

In ServiceNow, Incident records need accurate and complete information for proper **incident triage, assignment, routing, reporting, SLA management, and resolution**.

If users manually enter information without automated controls, they may:

- Leave important fields empty.
- Enter inconsistent information.
- Change fields that should be controlled.
- Submit an Incident without the required assignment information.
- Modify the **State** directly from the Incident list.
- Enter an incorrect **Urgency** for a high-impact Incident.

Proposed solution

Create a combination of:

- **UI Policy**
- **UI Policy Action**
- **onChange Client Script**
- **onSubmit Client Script**

- **onCellEdit Client Script**

What is this Project?

This project demonstrates how **ServiceNow client-side configuration** can be used to control an Incident form.

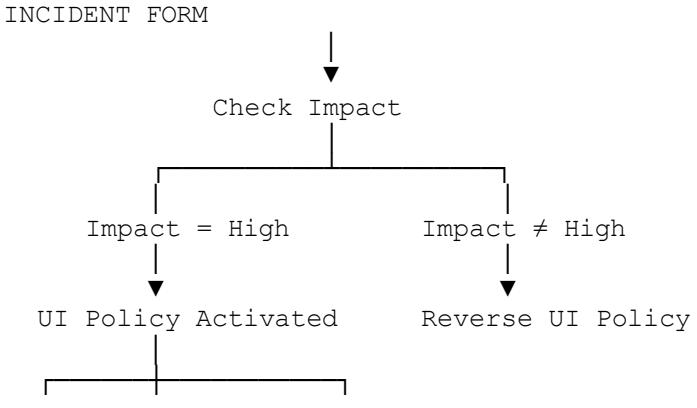

The main business scenario is:

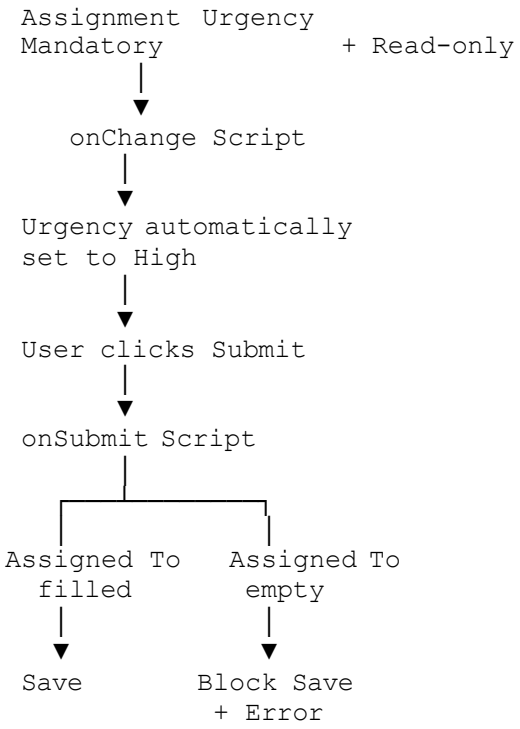

When an Incident has Impact = High, additional controls should automatically be applied.

The project implements the following behavior:

Scenario	Expected Behavior
Impact = High	Assignment Group becomes mandatory
Impact = High	Urgency is automatically set to High
Impact = High	Urgency becomes read-only
State edited from list	Record cannot be saved
State edited from form	Change is blocked
Impact = High + Assigned To empty	Change is allowed
Impact changed from High to Medium	High-impact restrictions are reversed

Project Architecture

About project

- This project is based on **ServiceNow Incident Management**.
- It uses **UI Policies and Client Scripts** to control Incident form behavior.
- The main purpose is to improve **data accuracy and consistency**.
- When **Impact is High**, Assignment Group becomes mandatory.
- Urgency is automatically set to **High** using an onChange Client Script.
- Urgency also becomes **read-only** through a UI Policy.
- An onSubmit Client Script prevents saving when **Assigned To is empty**.
- An onCellEdit Client Script prevents changing **State directly from the list**.
- State can still be changed through the **Incident form**.

- Overall, the project helps ensure that Incidents are created with **complete and** Valid information.

Final Solution

The final solution uses **ServiceNow UI Policies and Client Scripts** to improve the accuracy and consistency of Incident records. When the Incident Impact is set to **High**, the system makes Assignment Group mandatory, automatically sets Urgency to High, and makes the Urgency field read-only. The onSubmit Client Script prevents the Incident from being saved if the Assigned To field is empty. The onCellEdit Client Script also prevents users from changing the State directly from the Incident list, while allowing State changes through the Incident form. Overall, this solution provides automated validation and field control, helping users create complete and accurate Incident records.
