Project Design Phase

Solution Architecture

Date	29/9/2026
TeamID	SWTID-2026-5649
ProjectTitle	**Implement Client Script & UI Policy (Incident)**

Project Design – Solution

The project is designed to improve **Incident data quality and consistency** in ServiceNow by combining **UI Policies, UI Policy Actions, and Client Scripts**. The solution dynamically controls Incident fields based on the Impact value, automatically updates Urgency, validates required information before saving, and restricts State changes through list editing.

Solution Architecture Design

The architecture consists of the following layers:

1. User Interface Layer

- Incident Form
- Incident List View

2. UI Control Layer

- High Impact UI Policy
- UI Policy Actions
- Assignment Group mandatory
- Urgency read-only when Impact is High

3. Client-Side Logic Layer

- **onChange** → Automatically sets Urgency to High
- **onSubmit** → Prevents saving when Assigned To is empty for High Impact

- **onCellEdit** → Blocks State changes from the list view

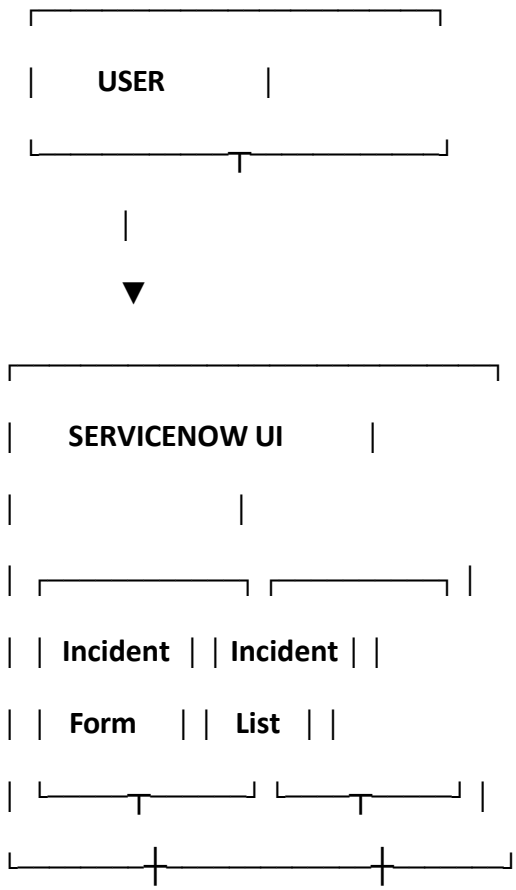

4. ServiceNow Incident Layer

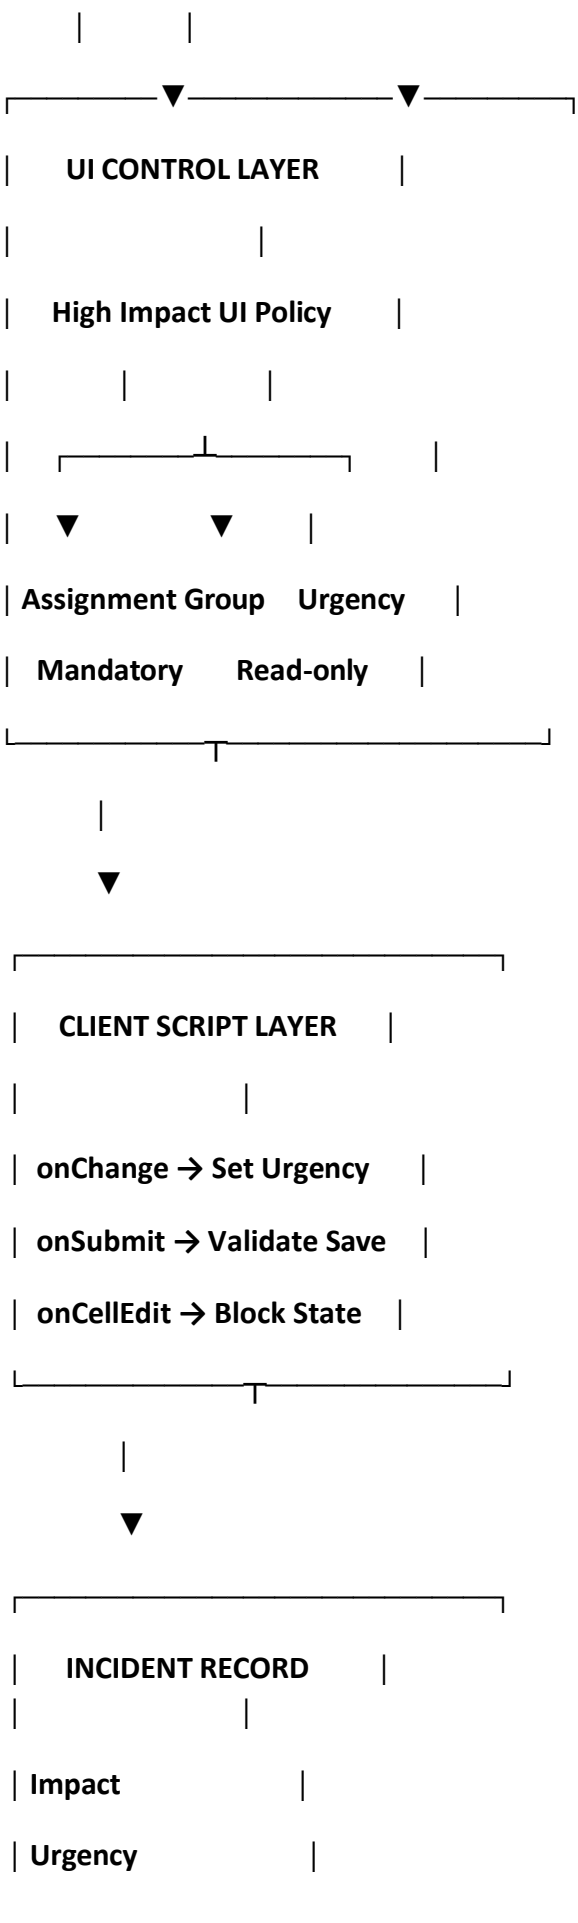

- Incident record
- Impact
- Urgency
- Assignment Group
- Assigned To
- State

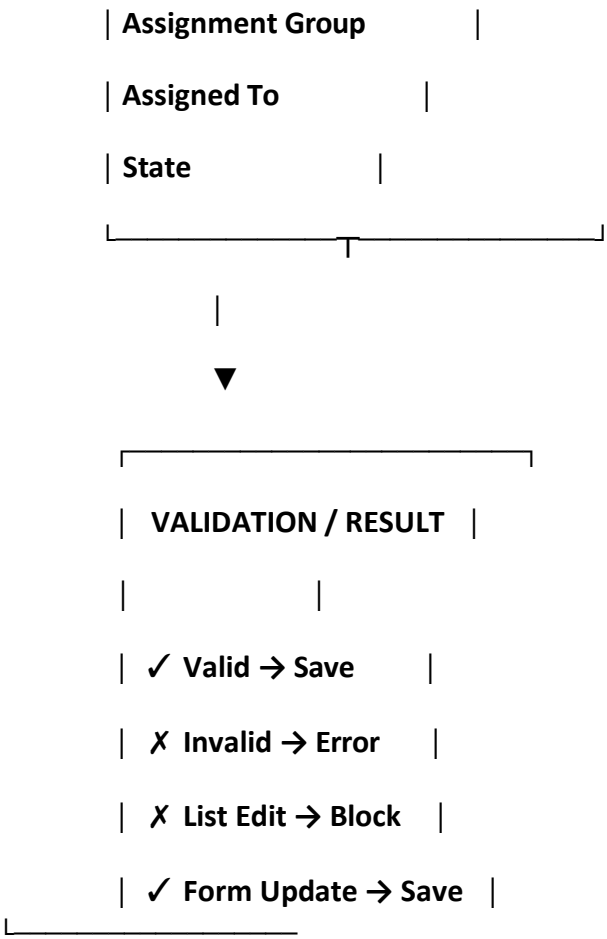

5. Validation & Output

- Valid Incident → Record saved
- Missing Assigned To → Save blocked
- List State edit → Change blocked
- Form State update → Change allowed
- Impact changed from High → UI Policy settings reversed

Solution Architecture Diagram

UI CONTROL LAYER
High Impact UI Policy
Assignment Group
Urgency
Mandatory
Read-only
CLIENT SCRIPT LAYER
onChange → Set Urgency
onSubmit → Validate Save
onCellEdit → Block State
INCIDENT RECORD
Impact
Urgency

Assignment Group
Assigned To
State
VALIDATION / RESULT
✓ Valid → Save
✗ Invalid → Error
✗ List Edit → Block
✓ Form Update → Save
