Project development Phase

User acceptance

Date	**29/9/2026**
Team ID	**SWTID-2026-5649**
Project Title	**Implement client scrip and UI policy(incident)**

User Acceptance phase verifies that the implemented Incident configuration meets the expected user and business requirements before it is considered complete. The PDF does not explicitly name a separate "User Acceptance Testing (UAT)" section, so the following is derived from its documented testing and expected outcomes.

User Acceptance Criteria

Acceptance Area	**User Acceptance Condition**	**Expected Outcome**
High Impact Handling	User selects **Impact = High**	High-impact controls are automatically applied
Assignment Requirement	User attempts to submit a High-impact Incident without Assigned To	System prevents submission and displays an error
Urgency Automation	User changes Impact to High	Urgency is automatically set to High

User Acceptance Outcome

The project can be considered **accepted when users can successfully create and update Incident records while the configured rules operate automatically and consistently**. In particular, required information must be enforced for High-impact Incidents, Urgency must respond correctly to Impact, unauthorized list editing must be prevented, and legitimate form-based updates must remain available.
